Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

bridging between microtubules and other skeletal elements.
-!- SUBUNIT: 3 different light chains, LC1, LC2 and LC3, can associate with MAPIA and MAPIB proteins.
-! TISSUE SPECIFICITY: BRAIN, HEART AND MUSCLE.
-!- DEVELOPMENTAL STRAGE: EXPRESSED LATE DURING NEURONAL DEVELOPMENT APPEARING WHEN AXONS AND DENDRITES BEGIN TO SOLIDIFY AND STABILIZE
                                                                                                                                                                                   DOMAIN: THe basic region containing the repeats may be responsible for the binding of MAPIA to microthubules.

PTM: Various serine residues may be phosphorylated by CAMP kinase. PTM: LC2 IS COEXPRESSED WITH MAPIA. IT IS A POLYPEPTIDE GENERATED FORM MAPIA BY PROTEOLYTIC PROCESSING. IT IS FREE TO ASSOCIATE WITH SIMILARITY: TO MAPIB.

"Splits ends is a tissue/promoter specific regulator of Wingless signaling.";

Development 130:13125-1335(2003).

-! FUNCTION: Probable corepressor protein, which regulates different key pathways such as the EGF receptor and Wg pathways. Involved in neuronal cell fate, survival and axon guidance, cell cycle regulation and repression of head identity in the embryonic trunk. May act with the Hox gene Deformed and the EGF receptor signaling pathway. Positive regulator of the Wg pathway in larval tissues but not in embryonic tissues. May act as a transcriptional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isold=Q86X83-4; Sequence=vSP_008565, VSP_008566, VSP_008567; NOGe=Produced by alternative splicing of isoform 2; TISSUE SPECIFICITY: Ubjuitous. Expressed prior to callularization in stage 3 embryos, and in blastoderm cells, including pole cells. Expressed throughout the rest of embryogenesis. Later, it is expressed at higher level in epidermal cells and CNS. DEVELOPMENTAL STAGE: Isoform 3 is expressed both maternally and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          zygotically.
--- SIMILARITY: Belongs to the Spen family.
--- SIMILARITY: Contains 3 RNA recognition motif (RRM) domains.
---- SIMILARITY: Contains 1 SPOC domain.
--- CAUTION: It is uncertain whether Met-1 or Met-7 is the initiator.
                                                                                                                                                                                                                                                                                                                                                                                                                   proteins.

Noce-No experimental confirmation available;
Noce-No Experimental confirmation available;
TISSUE SPECIFICITY: Highly expressed in testis. Expressed at lower level in brain, lung, spleen, liver and kidney. Weakly expressed in cardiac and skeletal muscles and ovary. In spleen, it is marginal zone B-cells, while it is weakly expressed in DOMAIN: The RID domain mediates the interaction with nuclear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- DOWALN: The SPOC domain, which mediates the interaction with NCOR2, is essential for the repressive activity (By similarity).
-!- SIMILARITY: Belongs to the Spen family.
-!- SIMILARITY: Contains 1 RID (receptor interacting) domain.
-!- SIMILARITY: Contains 1 RID (receptor interacting) domain.
-!- SIMILARITY: Contains 1 SPOC domain.
-!- CAUTION: Ref. 4 sequence differs from that shown due to multiple frameshifts and conflicts that create stop codons.
-!- CAUTION: Ref. 5 sequence differs from that shown due to what seems to be the presence of intronic sequence in the cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Event=Alternative splicing; Named isoforms=2;

The stanta representation of human microtubule-associated protein IA "Brain-specific expression of human chromosome 15.";

(MAPLA) gene and its assignment to human chromosome 15.";

U. Neurosci. Res. 40:820-825(1995).

-!- FUNCTION: Structural protein involved in the filamentous cross-bridging between microtubules and other skeletal elements.

-!- SUBUNIT: 3 different light chains, LCI, LC2 and LC3, can associate with MAPLA and MAPLB proteins.

-!- SUBUNIT: 3 different light chains, LCI, LC2 and LC3, can associate with MAPLA and MAPLB proteins.

-!- DOMAIN: THe basic region containing the repeats may be responsible containing of MAPLA to microtubules.

-!- DOMAIN: THe basic region containing the phosphorylated by CAMP kinase.

-!- PTM: LC2 IS COEXPRESSED WITH MAPLA. IT IS A POLYPEPTIDE GENERATED READ MAPLA AND MAPLB.

-!- PTM: LC2 IS COEXPRESSED WITH MAPLA. IT IS A POLYPEPTIDE GENERATED READ MAPLA AND MAPLB.

-!- SIMILARITY: TO MAPLB.

-!- DOMAIN: C2 domain 1 is involved in binding calcium and phospholipids. Calcium binds with low affinity but with high specificity and induces a large conformational change.
-!- SIMILARITY: Contains 2 C2 domains.
-!- SIMILARITY: Contains 1 PDZ/DHR domain.

-!-TISSUE SPECIFICITY: Plasma membrane of neurons as well as glial cells throughout the brain.
-!- PTM: Phosphorylated at multiple sites by different protein kinases and each phosphorylation event regulates the protein's structure and function (Potential).
-!- SIMILARITY: Contains 1 AnK repeats.
-!- SIMILARITY: Contains 1 death domain.
                                                                                                                                              regulated

-!- DCMAIN: C2 domain 1 is involved in binding calcium and phospholipids. Calcium binds with low affinity but with high specificity and induces a large conformational change.
-!- SIMILARITY: Contains 2 C2 domains.
-!- SIMILARITY: Contains 1 PDZ/DHR domain.

retinoblastoma protein (RB), CENP-E and BUBR1.
SUBUNIT: Homo- or heterodimer.
SUBCELLULAR LOCATION: Nuclear matrix (but not in the nucleolus),
reorganization to the Kinetochore/centromere (coronal surface of
the outer plate) and the spindle during mitosis.
DEVELOPMENTAL STAGE: Gradually accumulates during the cell cycle.
PTM: Hyperphosphorylated during mitosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7 DQLLKQVEALKMENSNLRQELEDNSNHLTKLETEASNMKEVLKQLQGSIEDEAMASSGQI

PNORTION: The function of brain MAPS is essentially unknown.
Phosphorylated MAPIB may play a role in the cytoskeletal changes
that accompany neurite extension. Possibly MAPIB Binds to at least
two tubulin subunits in the polymer, and this bridging of subunits
might be involved in nucleating microtubule polymerization and in
stabilizing microtubules.

--- SUBUNIT: 3 different light chains, LCI, LC2 and LC3, can associate
with MAPIA and MAPIB proteins.

--- TISSUE SPECIFICITY: Nervous system (spinal cord, brain stem,
booth or many cerebrum). Not expressed in liver, spleen, kidney,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. In derease during postnatal development and are low in adults. In derease during ganglia levels remain high throughout development. In dorsal root ganglia levels remain high throughout development.

INDUCTION: By nerve growth factor.

INDUCTION: By nerve growth factor.

INDUCTION: By nerve growth factor.

KKEE and KKIZI/V. repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.

PTM: LCI is coexpressed with MAPIB. It is a polypeptide generated from MAPIB by proteclytic processing. It is free to associate with both MAPIB, and MAPIB. It interacts with the amino-terminal region of MAPIB. (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cortex, spinal cord and sciatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CAUTION: A C-terminal fragment of this protein (residues 1597 to 2459) was originally described as neuraxin in Ref.3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TISSUE-Spinal cord;

Comment=A number of isoforms are produced;
Name=1; Synonyms=480-kDa isoform;
Isocd=2012955-1; Sequence=Displayed;
-! TISSUB SPECIFICITY: Expressed in brain and other tissues. Isoform
-! SIMILARITY: Contains 23 ANK repeats.
-! SIMILARITY: Contains 1 death domain.

Detection of somatic and germ-line alterations of human APC gene - used to diagnose, treat and study familial adenomatosus polyposis and sporadic colorectal cancer.

Disclosure; Page 47; 132pp; English.

This sequence is encoded by the APC (Adenomatous Polyposis Coli) generassociated with tumorigenesis, found on chromosome 5q. The sequence may be mutated by deletions insertions, investions, or point mutations of the gene . The APC gene is expressed in most normal tissues as well suggesting that APC is a tumour suppressor. The present sequence is the human adenomatous Polyposis coli (APC) gene product, which was used in the development of a novel method of diagnosing or prognosing an APC gene associated neoplastic tissue. The method comprises comparing APC gene coding sequences or mRNA in a tumour tissue, to APC gene coding sequences or mRNA in a non-neoplastic tissue, tumour tissue. APC is a tumour repressor expressed in most normal tissues. APC mutations are found in familial adenomatous polyposis and sporadic colorectal cancer patients. The method enables mutations to be detected to provide an indication of predisposition to cancer. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                           Cancer diagnosis - by detecting mutation(s) in adenomatous polyposis
                                                                                                                                                                                                    Groden J, Carlson M, Kinzler K;

The method comprises comparing APC gene coding sequences or mRNA in a tumour tissue, to APC gene coding sequences or mRNA in a non-neoplastic tissue, where a difference indicates an APC gene associated neoplasia of the

ö

e PJ, Joslyn Vogelstein B;

This invention relates to a novel method to aid in the diagnosis or prognosis of a neoplastic tissue of a human. The method involves detecting somatic alteration of wild-type adenomatous polyposis coli) protein in a tumour tissue isolated from a human (the alteration indicating neoplasia of the tissue). The method of the invention is method is useful in diagnosis or prognosis of a neoplastic tissue of a human. the method is useful in detection of genetic predisposition to cancer. The present sequence represents a protein sequence used in the method of the invention

Determination of alterations in APC or its expression products, can be used for the diagnosis and prognosis of cancer e.g. colorectal, lung and breast tumours, and for determining predisposistion to certain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a human familial adenomatous polyposis colin (APC) protein from clone DP2.5. The gene for the protein is present on human chromosome 521 and is also referred to as adenomatous polyposis coli gene. It is a tumour suppressor gene, and mutations in this gene tumours, and especially familial adenomatous polyposis (FAP) and despecially familial adenomatous polyposis (FAP) and colorectal tumours, and especially familial adenomatous polyposis (FAP) and calculated with tumourigenesis in retinoblastoma and colorectal tumours, syndrome (GS). The protein can be used in therapy to replace lack of native functional protein and the nucleic acids can be used for gene therapy. The nucleic acids that encode them can also be used as probes and primers in detection of the cancers and predisposition to it. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240

```
This sequence represents a human familial adenomatous polyposis coli (APC) protein isolated from 87 cDNA clones. The gene for the protein is present on human chromosome 5Q21 and is also referred to as adenomatous polyposis coli gene. It is a tumour suppressor gene, and mutations in colorectal tumours, and especially familial adenomatous polyposis (FAP) and Gardner's Syndrome (GS). The protein can be used in therapy to replace lack of native functional protein can be used in therapy to used for gene therapy. The mucleic acids that encode them can also be used as probes and primers in detection of the cancers and predisposition to it. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CLQTLLQHLKSHSLTIVSNACGTLWNLSARNPKDQBALWDWGAVSMLKNLIHSKHKMIAM 720
